Plan for 3 week.

① Part1:

- Review some Background of Linear Algebra
- Introduction of Linear Programming
- Simplex Method for Linear Programming
- Introduction to **Mathematica Programming or Matlab.**

② Part 2:

- Introduction to Dual Problem
- Introduction to Constraint and Unconstraint for Non- Linear Programming

③ Part 3:

- The Convex Optimization
- The Lagrange's method for Optimization.
- The Karush Kunh Tucker condition

Optimization Today

Decision making tools based on optimization procedures are successfully applied to a wide range of practical problems arising in virtually any sphere of human activities, including

- ◇ healthcare
- ◇ biomedicine
- ◇ energy management
- ◇ aerospace research
- ◇ telecommunications
- ◇ finance
- ◇ ...

Optimization Today

- ◇ Linear Programming
- ◇ (Mixed) Integer Programming
- ◇ Network Optimization
- ◇ Nonlinear Programming
- ◇ Combinatorial Optimization
- ◇ Global Optimization
- ◇ Stochastic Optimization

...

Introduction of Optimization Problem

An optimization problem consists of three main ingredients:

- a decision space X ,
- a constraint set $C \subset X$, and
- an objective function $f : U \rightarrow R$, where $U \subset X$ is nonempty,

Aim at finding a point $x^* \in C$ such that $f(x^*) \leq f(x)$ for all $x \in C$. This can be conventionally written as

$$Opt(f, C) \quad \begin{cases} \min & f(x) \\ s.t & x \in C \end{cases}$$

For the problem to make sense, we may require $C \subset U \neq \emptyset$.

Assume that $C \subset U \neq \emptyset$. We shall develop a shorthand notation $x^* \in \text{Opt}(f, C)$ denote that x^* is a solution to the optimization problem $\text{Opt}(f, C)$. Concerning with the problem $\text{Opt}(f, C)$, the point $x \in X$ is said to be feasible if it belongs to the constraint set C . If $C = X$ is feasible and the optimization problem is said to be unconstrained.

Notice that the constraint set C above can be just anything, hence the general form of $\text{Opt}(f, C)$ is said to be equipped with an abstract constraint. Of course, the constraint C can be described in a more explicit form, i.e. by inequalities and equalities:

$$C = \{x \in X \mid g_i(x) \leq 0, \quad h_j(x) = 0, \forall i = 1, 2, \dots, r, \forall j = 1, 2, \dots, l\}$$

where the (vector) functions $g = (g_1, g_2, \dots, g_r) : X \rightarrow \mathbb{R}^r$ and $h = (h_1, h_2, \dots, h_l) : X \rightarrow \mathbb{R}^l$ are given. In this case, $\text{Opt}(f, C)$ will be represented by $\text{Opt}(f, g, h)$ with

$$\text{Opt}(f, g, h) \quad \begin{cases} \min & f(x) \\ \text{s.t.} & g_i(x) \leq 0, \forall i = 1, 2, \dots, r \\ & h_j(x) = 0, \forall j = 1, 2, \dots, l \end{cases}$$

Some Application?

Economics: The consumer's demand functions

A consumer's preferences are represented by the utility function

$$u(x_1, x_2) = 2\ln x_1 + \ln x_2 \quad (1)$$

If the budget constraint is $p_1x_1 + p_2x_2 = M$,
Determine the demand functions, that is, the optimal values x_1^* and x_2^* ; in terms of p_1 , p_2 and M .

How to solve this problem?

Statistics :Support Vector Machines

Minimize

$$\frac{1}{2} \|w\|^2$$

subject to

$$y_i(w^T x_i - b) \geq 1, \forall i = 1, 2, \dots, n$$

How to solve this problem?

Financial Mathematics : Portfolio Selection

A portfolio constructed from n different stocks can be described in terms of their weights

$$w_i = \frac{x_i S_i(0)}{V(0)}$$

We can arrange it into a one-row matrix

$$w_i = [w_1, w_2, \dots, w_n]$$

so, the weights add up to one, which is

$$uw^T = 1$$

where

$$u = [1, 1 \dots 1]$$

Portfolio Selection

The expected return $\mu_v = E(K_v)$ and variance $\sigma_v^2 = V(K_v)$ of a portfolio with weights w are given by

$$\mu_v = mw^T$$

$$\sigma_v^2 = wCw^T$$

where, $m = [\mu_1, \mu_2, \dots, \mu_n]$ is the expected return matrix and C is the covariance matrix between return of n stocks.

Portfolio Selection

Minimum Variance Problem:
minimize

$$wCw^T \quad (2)$$

subject to

$$uw^T = 1 \quad (3)$$

where

w vector of portfolio weightings,

C covariance matrix,

u vector of 1s

How to solve this problem?

Markowitz Model

Minimum Variance Line Problem:
minimize

$$wCw^T \quad (4)$$

subject to

$$mw^T = \mu_b, uw^T = 1 \quad (5)$$

where,

μ_b target portfolio expected return , w vector of portfolio weightings,
 C covariance matrix, m expected return matrix, u vector of 1s

How to solve this problem?

Thank you for attention.
